### 1.1 (a)

Prove that every tournament has a hamilton directed path.

Take a tournament  $T$ .  $T$  has a directed path  $P$  of maximum length  $k$ ,  $v_0v_1v_2\ldots v_k$ .  $P$  starts at vertex  $v_0 \in V(T)$  and ends at  $v_k \in V(T)$ . Assume for a contradiction that  $P$  is not a hamilton path. This means there exists a  $u \in V(T)$  that is not in  $P$ . There is an edge going either to or from  $u$  and every  $v_i \in P$ . There are three cases that occur for  $u$ :

1. There is an edge going from  $u$  to  $v_0$ . If this is the case then we can simply add  $u$  to the beginning of  $P$  by adding the edge  $u \rightarrow v_0$ . This extends  $P$  so this is a contradiction.
2. There is an edge going from  $v_k$  to  $u$ . If this is the case we can add  $u$  to the end of  $P$  by adding the edge  $v_k \rightarrow u$ . This extends  $P$  so this is a contradiction.
3. The last case has an edge from  $v_0$  to  $u$  and an edge from  $u$  to  $v_k$ . This means that we cannot extend this path at the beginning or end, and we must splice  $u$  somewhere inside  $P$ . In order to splice  $u$  in we need a situation where there exists an edge  $v_{i-1} \rightarrow u$  and  $u \rightarrow v_i$ . As we go from  $v_0$  to  $v_k$  for each  $v_i$  the edge between  $v_i$  and  $u$  must either be the same or different then that of  $v_{i-1}$  and  $u$ . Since  $v_0 \rightarrow u$  and  $u \rightarrow v_k$  there must be at least one  $v_i$  such that the edge between  $v_i$  and  $u$  is different then the edge between  $v_{i-1}$  and  $u$ , if we take the smallest  $i$  where this first occurs, we know that  $v_{i-1}$  is in the direction from  $v_{i-1} \rightarrow u$  (This is because  $v_0 \rightarrow u$  and the first time that an edge goes in a different direction, it must be the opposite of this). Let us splice  $u$  in using the edges  $v_{i-1} \rightarrow u$  and  $u \rightarrow v_i$ . This extends  $P$  which is a contradiction.

Since we reach a contradiction in all three cases,  $P$  must be a hamilton path. ■

### 1.2 (b)

Show that every tournament of size three or more vertices is either strong or can be transformed into a strong tournament by the reorientation of just on arc.

Let us take a tournament. Based on part a, we know that there is a hamilton path beginning with a vertex  $x \in V(T)$ , and ending with a vertex  $y \in V(T)$ . There are two cases to consider:

1. If there is an edge going from  $y \rightarrow x$  then there exists a hamilton cycle, and by following this cycle every vertex is reachable from every other vertex.
2. If there is an edge going from  $x \rightarrow y$  then reverse this edge and we are left with Case 1 (a strong tournament by reorienting one edge). ■
